Examination report No. 1 for standard patent application

Delivering a world leading IP system

www.ipaustralia.gov.au

ABN: 38 113 072 755

LAMINAR IP PTY LTD

PO Box 1188
North Sydney NSW 2059
Australia

Your reference: P120867AU
Application number: 2026201831
Applicant name: Letsdex Pty Ltd
Earliest priority date: 11 March 2026

Final date for acceptance: 1 May 2027
Date of this report: 1 May 2026
Examination request date: 11 March 2026

Dear LAMINAR IP PTY LTD,

Your application has been examined under [section 45 of the Patents Act 1990](#). I consider that this application does not meet the requirements of the Act because there are issues with the application that are explained in the report details.

You have **12 months** from the date of this report to overcome all my objection(s) otherwise this application will lapse.

You will also need to pay any annual continuation fees that apply. Your next continuation fee is due on **11 March 2030**.

Details of this patent application can be viewed on [Australian Patent Search](#).

Yours sincerely,

Kurt Findlay

Report details

Basis of the report

In examining this application I have considered:

- the specification as filed.

Summary of novelty, inventive step and patentable subject matter

	<i>Satisfy requirements?</i>	<i>Claim numbers</i>
Novelty/inventive step	Yes	NONE
	No	1-20
Patentable subject matter	Yes	1-20
	No	NONE

Detailed objections on issues that have been identified

Section 40 (support, disclosure, clarity, lack of unity)

- 1 **Claim 4** lacks clarity because it recites performing validity verification "*on a public user key*". Signature verification would ordinarily be performed *using* a public key, and the description appears to support that interpretation. The claim has therefore been construed on that basis.

Claim 5 is unclear because it refers to "*collateral assets corresponding to the user*". It is unclear as to whether the collateral to be confiscated belongs to the user who submitted the state assertion or to a validator, because the description appears to refer to confiscating collateral assets of a fraudulent voting validator in the context of a failed state assertion.

Claim 5 is also unclear due to inclusion of the term "*the state verification result*" which lacks an antecedent basis when appended to **claim 2**. This term is introduced in **claim 4**, so it has been construed that **claim 5** is meant to be appended to **claim 4**.

Claims 9-10 are unclear because **claim 9** defines a "*target threshold*" as including different types of thresholds e.g. a validator quantity threshold, consensus ratio threshold, or verification score threshold. **Claim 10** then states that the "*target threshold*" is directly or inversely proportional to various factors, but it is unclear whether each proportional relationship applies to every type of threshold or just some of them.

Documents cited or considered relevant

D1: CN 113806699 A (NAT UNIV DEFENSE TECHNOLOGY PLA) 17 December 2021 ^[1]

& References pertaining to this citation were made through use of Espacenet's Machine Translation Tool

Category: Y Claims: 1-20

D2: US 2020/0137064 A1 (EMC IP HOLDING CO LLC) 30 April 2020 ^[1]

Category: Y Claims: 1-20

[1] Document found in an original search

Special categories of cited documents:

Y: The claimed invention cannot be considered to involve an inventive step under [subsection 7\(2\)](#) of the Act in light of the common general knowledge when considered together with a combination of the document and one or more other such documents.

&: Document member of the same patent family.

Novelty and inventive step

2 **Claims 1-20** do not involve an inventive step in view of **D1** combined with **D2**.

D1 (see Abstract; [0007]-[0011], [0013]-[0018], [0035]-[0042], [0050]-[0057], [0079]-[0088]; Figs. 1-4) discloses a cross-blockchain verification method using decentralised identifiers (DIDs) and verifiable credentials (VCs). Users or other entities register to obtain DIDs, and VCs are issued for those DIDs. The VCs are recorded as claim objects, which include identifiers such as a claim ID for identifying the relevant VC or claim. A DID blockchain acts as a relay between blockchains, allowing signing and verification to take place across different chains. A verifier can use the identifier to retrieve the relevant VC or claim, check it, give an acceptance or rejection result, and publish that result through a consensus process (e.g. Tendermint). This provides the main cross-chain verification framework in that credentials are identified, retrieved, verified, and the verification results are handled by consensus.

However, **D1** does not explicitly teach storing the digitally signed verifiable credential in a distributed storage system as required by **claim 1**, or validators accessing that distributed storage system using the credential identifier to determine the digitally signed verifiable credential as required by **claim 2**. **D1** also does not explicitly disclose the specific claimed form of the VC, namely that it includes a state assertion and a content hash of that state assertion and is signed using a user private key corresponding to the DID.

D2 (see Abstract; par. [0004]-[0008], [0051]-[0064], [0066]-[0070], [0072]-[0079], [0083]-[0095], [0101]-[0105]; Figs. 3-8) discloses a decentralised identity system where identity records are kept on an identity blockchain, but the underlying data is stored separately in decentralised storage such as IPFS/IPNS. The identity record includes a public key linked to the user's private key, so the private key can prove control of the identity, and the public key can verify that proof. IPFS is used for immutable, content-addressed data, while IPNS is used for changeable data such as certificate-related information. The system also allows an identity chain to work with an application chain: peers retrieve the user's public key and certificate, check a request signed with the user's private key, verify the certificate, check permissions, and only then commit the transaction. This teaches the missing distributed storage and private-key/public-key verification features and also supports using a hash to identify or check stored content.

The problem addressed by the claimed invention is that existing cross chain verification methods, such as centralised bridges or oracle networks, involve verification weaknesses which result in low security. **D1** already addresses provision of a decentralised cross chain verification framework. In seeking to improve that system, the person skilled in the art would be motivated to apply **D2**'s decentralised storage arrangement because **D2** teaches storing *only* addresses on chain and storing everything else off chain to reduce blockchain scalability burdens whilst maintaining security.

Combined, the skilled person would arrive at a system where the signed DID/VC credential is stored in distributed storage, retrieved by validators using its identifier, checked using public-key/signature verification, and used with consensus results to decide whether the destination-chain request should proceed. The business identifier identifies the requested operation, and the executable condition is simply the required successful verification result before that

operation is carried out.

Therefore, independent **claims 1 & 2** lack an inventive step in light of the combination of **D1** and **D2**.

Similar observations apply, *mutatis mutandis*, to independent **claims 17 & 18** which disclose corresponding apparatus claims to carry out the methods of **claims 1 & 2**.

Furthermore, appended **claims 3-16 & 19-20** add only features that are either disclosed in the above cited documents or are common general knowledge/obvious choices in the art and which therefore cannot contribute to an inventive step. For example, **claims 4, 6-7 & 16** are disclosed and/or made obvious by **D2** (see par. [0092]), **D1** (see par. [0042]) and **D1** (see par. [0037]), respectively.

END OF REPORT

Search information statement

The search information statement outlines the search the examiner carried out for your patent application. This statement shows the search databases, keywords, chemical structures and patent classification symbols (IPC and CPC) searched during the examination process.
